TC 1700

Patent Office  
Canberra

I, JONNE YABSLEY, TEAM LEADER EXAMINATION SUPPORT AND SALES hereby certify that annexed is a true copy of the Provisional specification in connection with Application No. PR 3478 for a patent by JAMES HARDIE RESEARCH PTY LIMITED filed on 02 March 2001.

WITNESS my hand this  
Eighteenth day of March 2002

A handwritten signature in cursive script that reads "J R Yabsley".

JONNE YABSLEY  
TEAM LEADER EXAMINATION  
SUPPORT AND SALES

**PROVISIONAL SPECIFICATION**

***FOR THE INVENTION ENTITLED:-***

**"COATINGS FOR BUILDING PRODUCTS"**

The invention is described in the following statement:-

### **Technical Field**

The present invention relates to coatings and in particular coatings for building products and laminated building products.

### **Background Art**

5        There are a huge variety of mechanisms for applying coatings to building products such as building boards.

The coatings can be divided into two main groups namely finishing coatings, which are intended primarily for aesthetic purposes, and functional coatings which provide some additional structural or other property/attribute to the resultant product.

10       The application technique depends to a large extent on the properties of the coating composition and base layer or product to be coated. Manual application and spraying etc are most popular but they restrict the types of coating to be applied and indeed the building product to be coated. For example, when using a spray technique, one must ensure the coating composition is of sufficient flowability to pass through the spray  
15       nozzle but at the same time, the base material to be coated must be sufficiently rigid to withstand the impact of the spray coating.

For certain building products, such as internal wall systems, a smooth surface finish is vital. Gypsum or plaster board is used almost exclusively as an internal wall board due to its excellent surface finish.

20       The use of fibre reinforced cement building board for instance as an internal wall board has significant advantages including cost and structural integrity as compared with gypsum board. However, some techniques for production of fibre reinforced cement sheets do not provide a gypsum like surface finish. In response to public demand, builders require an internal wall board with a near perfect surface finish. Even minute

irregularities which arise from production of fibre reinforced cement sheets can be sufficient to reject the product. Sanding the surface of the FRC sheet has been used to improve its surface finish but in some instances such sanding can 'feather' or leave exposed the reinforcing fibres thereby exacerbating the problem.

5       The foregoing discussion of the prior art is not to be construed as an admission with regard to the common general knowledge in Australia.

It is an object of the present invention to overcome or ameliorate at least one of the disadvantages of the prior art, or to provide a useful alternative.

#### **Disclosure of the Invention**

10       In a first aspect, the present invention provides a method for coating a building product comprising providing a coating formulation including an hydraulic binder and a quantity of dewatering agent, producing a slurry of said formulation, applying said slurry to said building product and dewatering said slurry through said building product with or without vacuum assistance.

15       In a second aspect, the present invention provides a method of providing a cementitious coating for a building product comprising providing a coating formulation including an hydraulic binder and a quantity of dewatering agent, forming a slurry from said formulation and applying said slurry to a product to be coated wherein the quantity of dewatering agent is sufficient to permit dewatering of the slurry through the product to  
20 be coated.

In a third aspect, the present invention provides a formulation for coating a building product comprising an hydraulic binder and a quantity of dewatering agent sufficient to permit dewatering of the slurry through the building product.

In a fourth aspect, the present invention provides a self levelling dewaterable slurry for coating a building product, said slurry comprising water, an hydraulic binder and a quantity of dewatering agent sufficient to permit dewatering of said slurry through said building product.

5        In a further aspect, the present invention provides a method of improving an hydraulic binder based coating formulation for coating a building product comprising adding to said binder a quantity of dewatering agent such that after application of a slurry of said formulation to said building product, said slurry can be dewatered through the building product.

10       In still a further aspect, the present invention provides a composite product comprising a base structural layer with a coating thereon, the coating including an hydraulic binder and a quantity of dewatering agent sufficient such that during application of the coating to the base layer, the coating may be dewatered through the base layer. Preferably but not essentially, the base layer is a building product, most  
15       preferably a fibre reinforced cementitious building product such a building board.

Unless the context clearly requires otherwise, throughout the description and the claims, the words 'comprise', 'comprising', and the like are to be construed in an inclusive sense as opposed to an exclusive or exhaustive sense; that is to say, in the sense of "including, but not limited to".

20       The dewatering agent serves to maintain sufficient porosity in the slurry and product to be coated to permit dewatering of the slurry through the product to be coated. Preferably, the dewatering agent is a particulate material such as fly ash, alumina trihydrate, silica flour, cenospheres (ceramic hollow spheres) or similar.

Fly ash is particularly preferred as it permits dewatering of the slurry within a few minutes. Other particulate dewatering agents such as alumina trihydrate or silica flour may also be used, however, they increase the time required for dewatering of the slurry through the product to be coated.

- 5        In a preferred embodiment, the slurry applied to the product to be coated has a high water content. Preferably, the water content can be up to 50%. This is in contrast to previous cementitious formulations which generally have a higher solids content.

- By combining the various components of the coating formulation described above, a self levelling dewaterable slurry is obtained which can be applied to the building  
10    product, dewatered through the building product and thereby provide a uniform coating over the building product.

Normally, after application of the coating, the resultant product would be normally cured, steam cured or hydrothermally cured, ie autoclaved, and if required, sanded to a smooth flat finish.

- 15        The building product to which the coating can be applied is virtually limitless provided the slurry can be dewatered through the building product. Cementitious and gypsum building boards are typical examples of suitable building products on which the coating can be applied.

- The resultant coating, which may optionally contain fibres, results in a decorative  
20    finishing layer which is sandable, smooth, flat, low permeable, crack free and/or flexible, ready to be finished, for example by painting.

The thickness of such a coating layer prior to sanding would range from around 0.5 to 10 mm, preferably 1 to 5 mm and most preferably 1.5 to 3 mm.

After sanding, the finish layer may have a depth of around 0.2 to 5 mm, preferably 0.4 to 2 mm and most preferably 0.5 to 1 mm. The thus produced coated product is comparable in its workability to monolithic (single layer) composites. It can be flexed, cut, drilled and fixed by nails etc to a frame without surface cracking or chipping.

5       The applicant's have found an extremely good interlaminar bond and compatibility between the dewatered slurry layer and base layer resulting in excellent composite action, compatibility and resistance to delamination.

The term 'hydraulic binder' as used throughout the specification refers to a pulverised material in the solid, dry state which, when mixed with water, yields plastic  
10       mixtures that are able to set and harden, for example a cement. Included within the definition are white, grey or pigmented cements and hydraulic limes.

The term 'cement' includes hydraulic and alite cements such as portland cement, blended cements such as portland cement blended with fly ash, blast-furnace slag, pozzalans and the like and mixtures thereof, masonry cement, oil well cement, natural  
15       cement, alumina cement, expansive cements and the like, or mixtures thereof.

The quantity of binder in the formulation is preferably between 10 to 50 wt% based on the total dry ingredients, more preferably 15 to 40 wt% and most preferably 20 to 30 wt%.

The fly ash used in the present invention provides a number of advantages  
20       including, particularly, as an aid to dewatering of the slurry as defined above.

The term 'fly ash' as used herein refers to a solid powder having a chemical composition similar to or the same as the composition of material that is produced during combustion of powdered coal, ie 25 to 60 wt% silica, 10 to 30 wt%  $Al_2O_3$ , 5 to 25 wt%  $Fe_2O_3$ , 0 to 20 wt% CaO and 0 to 5 wt% MgO.

Fly ash particles are typically spherical and range in diameter from 1 to 100 microns. In a preferred embodiment, the fly ash comprises two components. A first 'larger' size particles of fly ash with preferably a 100 micron maximum size. This size range of fly ash is used in the slurry to aid in improving the dewatering characteristics of the slurry but also as a moderately reactive pozzolan.

The second 'smaller' fly ash size zone which preferably has a 10 micron maximum size also adds an improving dewatering characteristic but is a more highly reactive pozzolan. This 'smaller' fly ash particle zone also improves the sanded surface quality of the finish layer.

10 In a preferred embodiment, the first fly ash comprises 10 to 60 wt% of the formulation based on total dry ingredients, more preferably 20 to 50 wt% and most preferably 30 to 40 wt%.

The second fly ash component preferably provides 5 to 30 wt% of the formulation based on total dry ingredients, more preferably 10 to 25 wt% and most preferably 15 to 20%.

In still a further aspect, the present invention provides a dewatering aid for dewatering a cementitious coating on a product, said dewatering aid comprising a quantity of fly ash sufficient to permit dewatering of the slurry through the product to be coated.

20 The coating may optionally contain other additives such as fillers. Such fillers may also be used to improve the dewatering characteristics of the slurry. For example, cenospheres (hollow ceramic microspheres) diatomite, wollastonite, ground rice hulls, ground perlite or the like, are particularly suitable for this purpose.

These and other fillers may also be used to provide additional benefits, for example calcium carbonates or alumina hydrates improve sandability and flexibility of the coated layer respectively. Silica flour improves hardness of the sanded surface of the coating layer and the acoustic/thermal insulation properties of the layer can be improved by  
5 including rubber particles, vermiculite, perlite, expanded polystyrene or gypsum.

The fillers preferably comprise 5 to 30 wt% of the formulation based on total dry ingredients, more preferably 10 to 25 wt% and most preferably 25 to 20 wt%.

The coating may also contain other organic additives. Cement plasticising agents, for example, may be used to alter the rheology of the slurry. Suitable cement plasticising  
10 agents include melamine sulphonate formaldehyde condensates, naphthalene sulphonate formaldehyde condensates, naphthalene sulphonates, calcium lignosulphonates, sodium lignosulphonates, saccharose, sodium gluconate, sulphonic acids, carbohydrates, amino carboxylic acids, polyhydroxycarboxylic acids, sulphonated melomine and the like.

The amount of cement plasticiser of course will depend upon the fluidising ability  
15 of the particular plasticisers. Generally the quantity of plasticiser will be in the range of 0.3 to about 3 wt% and more preferably 0.5 to 2 wt% based on the total of dry ingredients in the formulation.

Particularly preferred cement plasticisers are Melment F-10, a melamine formaldehyde sodium bisulphate polymer dispersant marketed by SKW-Trostburg in the  
20 form of a fine white powder. Another suitable plasticiser is Neosyn, a condensed sodium salt of sulphonated naphthalene formaldehyde available from Hodgson Chemicals.

Another preferred component in the coating is a biopolymer which acts to enhance the flowability, segregation resistance and self levelling qualities of the cementitious

slurry. Particularly suitable biopolymers are xanthene gum and/or whelan gum, eg  
KELCO-CRETE, K1C 376 manufactured by Monsanto.

Latex may also be included in the coating composition to improve adherence,  
elasticity, stability and impermeability of the coating. The latex also improves flexibility  
5 of the formed coating.

The latex may be selected from the group consisting of acrylic latex, styrene latex,  
butadiene latex or mixtures thereof and is provided preferably in an amount between 0.5  
to 20%, more preferably 1 to 15% and most preferably about 10% by weight of cement  
(on polymer solids basis) solids.

10 Vinyl polymers may also be incorporated into the coating either in addition or as a  
substitute to the latex emulsions. Such vinyl polymers or equivalent polymeric materials  
enhance adhesion, resilience and flexural strength and abrasion resistance of the coating.

Preferred vinyl polymers include polyvinyl acetate or a copolymer vinyl acetate  
with another monomer such as ethylene. A particularly preferred vinyl acetate resin is  
15 VINNAPAS LL5044 thermo plastic resin powder which contains a vinyl acetate-  
ethylene copolymer available from Wacker. Such powdered vinyl polymer is preferably  
provided in quantities similar to the latex emulsion referred to above.

In addition to the above, conventional other additives such as mineral oxides,  
hydroxides and clays, metal oxides and hydroxides, fire retardants such as magnesite,  
20 thickeners, silica fume or amorphous silica, water sealing agents, water reducing agents,  
setting modifiers, hardeners, dispersants, foaming agents or flocculating agents, water-  
proofing agents and density modifiers are suitable for use with the present invention.

In this regard, one particular advantage arising from the present invention is the  
ability to treat the product to be coated by providing additives in the coating. To explain,

since the coating is dewatered through the product to be coated, it is possible to provide additives to the base layer by incorporation in the slurry. For instance, a waterproofing agent such as silane may be included in the coating in excess of the coating layers requirements. During dewatering, the silane will be drawn into and through the base layer being coated thereby treating the base layer. This simultaneous treatment of the base layer as well as coating the base layer is a valuable additional benefit arising from the aforescribed method.

### **Best Mode for Carrying Out the Invention**

The present invention will now be described by way of example only with reference to the following embodiments.

In each of the following examples, the product was produces as follows.

#### **Step 1 Slurry preparation**

A slurry of the formulation is prepared by mixing the hydraulic binder, fly ash and other optional components with water. The solids content in the slurry is preferably between 50 and 90%, more preferably 55 to 80% and most preferably 60 to 70%.

#### **Step 2 Slurry application/dewatering**

The slurry is applied to the base layer by any convenient means such as brushes rollers, knives or sprays etc. The slurry is designed to self level and form a uniform coating on the product. The building product to be coated exhibits s certain degree of porosity causing the slurry to dewater and form a uniform deposited cementitious layer. Time for dewatering can vary quite dramatically but normally occurs between 10 and 90 seconds, depending on the porosity of the material to be coated, its water content and thickness and viscosity of the slurry formulation. A vacuum may be used to reduce the slurry dewatering time if required. This is particularly useful when tailoring the coating

process to the speed of a building product forming process, eg between 40 to 45 seconds on a Hatschek production line.

### Step 3 Curing

After forming, the green laminate article comprising the building product plus  
5 coating is preferably precured for a short time, eg up to 48 hours, then cured by air/moist curing at room temperature, steam curing between 40 and 90°C or autoclaving in a steam pressure vessel between 120 and 200°C.

For either of these three curing techniques, a curing time range between 6 and 72  
hours, preferably up to 48 hours, is suitable. Of course, as will be clear to persons  
10 skilled in the art, the length of time chosen for curing is dependent on the formulation, the manufacturing process and form of the article.

The following examples relate to specific formulation compositions.

#### **Example 1: Sandable Dewatered Slurry Composition**

Function: sandable, durable finishing layer for façade applications.

15 The low viscosity slurry (drainage time in 50 ml volume funnel = 3.4 seconds) was applied on the base layer (Hardiform™ 12 mm thick cellulose fibre reinforced cement-based green sheet manufactured by James Hardie Industries). The slurry dewatered in 90 seconds (un-aided by vacuum) forming a 1.25 mm thick coating. The coated sheet was autoclave-cured for 8 hrs at 180 °C temperature and 0.80 MPa pressure. It was then  
20 sanded flat to 0.60 mm thick using industrial sanders equipped with 100 grit sand paper belts.

Slurry Composition	% by total weight of solids (S)	Weight in gm
<b>Dewatered Cementitious Composition</b>		
Portland Cement	30	12000
Silica Flour (400 G grade)	10	4000
Fly ash (larger size fraction)	40	16000
Fly ash (smaller size fraction)	20	8000
<b>Total</b>	<b>100</b>	<b>40000</b>
Water (W)		14000
<b>Water/ Solids (W/S ratio)</b>	<b>0.35</b>	
<b>Solids Content (W/W+S)</b>	<b>0.74</b>	
<b>Organic Additives</b>		
Welan Gum (Kelcocrete)	0.0075	3.0
naphthalene formaldehyde Plasticising Agent (Neosyn)	0.25	100.0
Acrylic Emulsion Rhoplex MC1934	1.0	400.0

### Example 2: Rubberised Dewatered Slurry Composition

Function: Finishing layer in skid-resistant flooring, hard wearing static dissipative flooring and acoustic insulating ceiling panels.

The low viscosity slurry (drainage time in 50 ml volume funnel = 4.2 seconds) was applied on the base layer (Hardiform™ 12 mm thick cellulose fibre reinforced cement-based green sheet manufactured by James Hardie Industries). The slurry dewatered in 60 seconds (un-aided by vacuum) forming a 1.25 mm thick coating. The coated sheet was autoclave-cured for 8 hrs at 180 °C temperature and 0.80 MPa pressure. It was then sanded flat to 0.60 mm thick using industrial sanders equipped with 100 grit sand paper belts.

Slurry Composition	% by total weight of solids (S)	Weight in gm
<b>Dewatered Cementitious Composition</b>		
Portland Cement	30	12000
Recycled Rubber crumbs (minus 30 mesh)	10	4000
Fly ash (larger size fraction)	40	16000
Fly ash (smaller size fraction)	20	8000
<b>Total</b>	<b>100</b>	<b>40000</b>
Water		13000
<b>Water/ Solids (W/S ratio)</b>	<b>0.325</b>	
<b>Solids Content (W/W+S)</b>	<b>0.755</b>

naphthalene formaldehyde Plasticising Agent (Neosyn)	0.25	100.0
Acrylic Emulsion Rhoplex MC1934	1.0	400.0

### Example 3: Flexible & Sandable Dewatered Slurry Composition

- 5 **Function:** Flexible & sandable finishing layer on thin fibre cement reinforced cement-based lining.

The low viscosity slurry (drainage time in 50 ml volume funnel = 2.8 seconds) was applied on the base layer (Hardiflex™ 4.5 mm thick cellulose fibre reinforced cement-based green sheet manufactured by James Hardie Industries). The slurry dewatered in 10 120 seconds (un-aided by vacuum) forming a 1.25 mm thick coating. The coated sheet was precured for 48 hours then was autoclave-cured for 8 hrs at 180 °C temperature and 0.80 MPa pressure. It was then sanded flat to 0.60 mm thick using industrial sanders equipped with 100 grit sand paper belts.

Slurry Composition	% by total weight of solids (S)	Weight in gm
<b>Dewatered Cementitious Composition</b>		
Portland Cement	20	8000
Calcium Carbonate Grade 10 (40um avg. size)	10	4000
Alumina Tri-hydrate (80 um avg. size)	5	2000
Fly ash (larger size fraction)	45	18000
Fly ash (smaller size fraction)	20	8000
<b>Total</b>	<b>100</b>	<b>40000</b>
Water		12000
<b>Water/ Solids (W/S ratio)</b>	<b>0.30</b>	
<b>Solids Content (W/W+S)</b>	<b>0.77</b>	
<b>Organic Additive</b>		
Welan Gum (Kelcocrete)	0.0075	3.0
naphthalene formaldehyde Plasticising Agent (Neosyn)	0.25	100.0
Styrene Acrylic Latex Emulsion (56% solids)	5	2000

#### Example 4: Flexible & Sandable Dewatered Slurry Composition

**Function:** Flexible & sandable finishing layer on thin fibre cement reinforced cement-based lining.

The low viscosity slurry (drainage time in 50 ml volume funnel = 4.5 seconds) was applied on the base layer (Hardiflex™ 4.5 mm thick cellulose fibre reinforced cement-based green sheet manufactured by James Hardie Industries). The slurry dewatered in 90 seconds (un-aided by vacuum) forming a 1.25 mm thick coating. The coated sheet was autoclave-cured for 8 hrs at 180 °C temperature and 0.80 MPa pressure. It was then sanded flat to 0.60 mm thick using industrial sanders equipped with 100 grit sand paper belts.

Slurry Composition	% by total weight of solids (S)	Weight in gm
<b>Dewatered Cementitious Composition</b>		
Portland Cement	10	4000
Calcium Carbonate Grade 10 (40um avg. size)	20	8000
Alumina Tri-hydrate (80 um avg. size)	5	2000
Fly ash (larger size fraction)	40	18000
Fly ash (smaller size fraction)	25	10000
<b>Total</b>	<b>100</b>	<b>40000</b>
Water		16000
<b>Water/ Solids (W/S ratio)</b>	<b>0.40</b>	
<b>Solids Content (W/W+S)</b>	<b>0.715</b>	
<b>Organic Additives</b>		
Welan Gum (Kelcocrete)	0.0075	3.0
naphthalene formaldehyde Plasticising Agent (Neosyn)	0.25	100.0
Vinyl acetate-ethylene powdered copolymer (Vinnapas LL5004)	1.625	650

The aforementioned examples provide a coated product comparable in workability to monolithic or single layer composites. They can be flexed, cut, drilled or fixed by  
5 nails or the like to a frame without surface cracking or chipping.

The surface is 'finish-ready' and remains smooth, flat, crack-free and with low permeability even when used in a curved configuration.

Each examples provided excellent interlaminar bond between the base sheet and coating exhibiting good composite action, compatibility and resistance to delamination.

10 It can be seen that the present process provides a significant improvement not only in the attributes of the product but also in the ability to tailor the surface finish of a building product to match particular requirements. Examples of particular formulations to provide the desired finish characteristic include

- a) Terrazzo (hardwearing decorative finish) - the finishing layer of the  
15 dewatered slurry can contain marble chips and pigmented cements and fillers. It may

then be sanded and polished to form a hardwearing decorative finish. Such a coating on, for example, a fibre cement backing board, could be used as flooring tiles, decorative wall lining or external prefinished fibre cement cladding.

b) Stucco (orange peel) Finish -this may be achieved by manipulating speed and volume of the applied slurry to achieve a stucco look on the finishing layer. Once again, such a product may be used as an external pre-finished cement cladding.

c) Sandable finish - this is probably the simplest and most straightforward application of the coating technique to provide a coating layer which may be sanded and sealed, thereby providing a paint ready smooth, crack-free and low permeable surface. Such a product may be used for a variety of internal and external uses.

d) Flexible finish - the coating layer may include various fillers and other additives to improve its flexibility, eg ethylene vinyl acetate, styrene butadiene rubber, styrene acrylic. It is designed to be a sandable, workable ie by score and snap, nailable, crack-free, non-chipping, flexible and bendable, paint ready surface. Such a coating could normally be applied to reasonably thin building product to permit flexibility. It has a wide variety of uses but is particularly suitable as an internal lining in wet area applications or as an external cladding element, eg as a paint ready fibre cement siding.

e) Skim-coated finish - such a coating of the dewatered slurry may be applied to gypsum based building products thereby providing a smooth, flat, pre-skim coated and paint ready surface.

f) Rubberised finish - by the addition of rubber crumbs into the slurry formulation, a coating layer may be provided on say a fibre cement backing for use as a skid resistant flooring, hardwearing static dissipative flooring or acoustic insulating ceiling panels.

It will be understood by persons skilled in the art that the present invention may be embodied in other forms without departing from the spirit or scope of the inventive idea as described herein.

DATED this 2nd Day of March 2001
